

Corruption Perception & Happiness Analysis

Tools Used

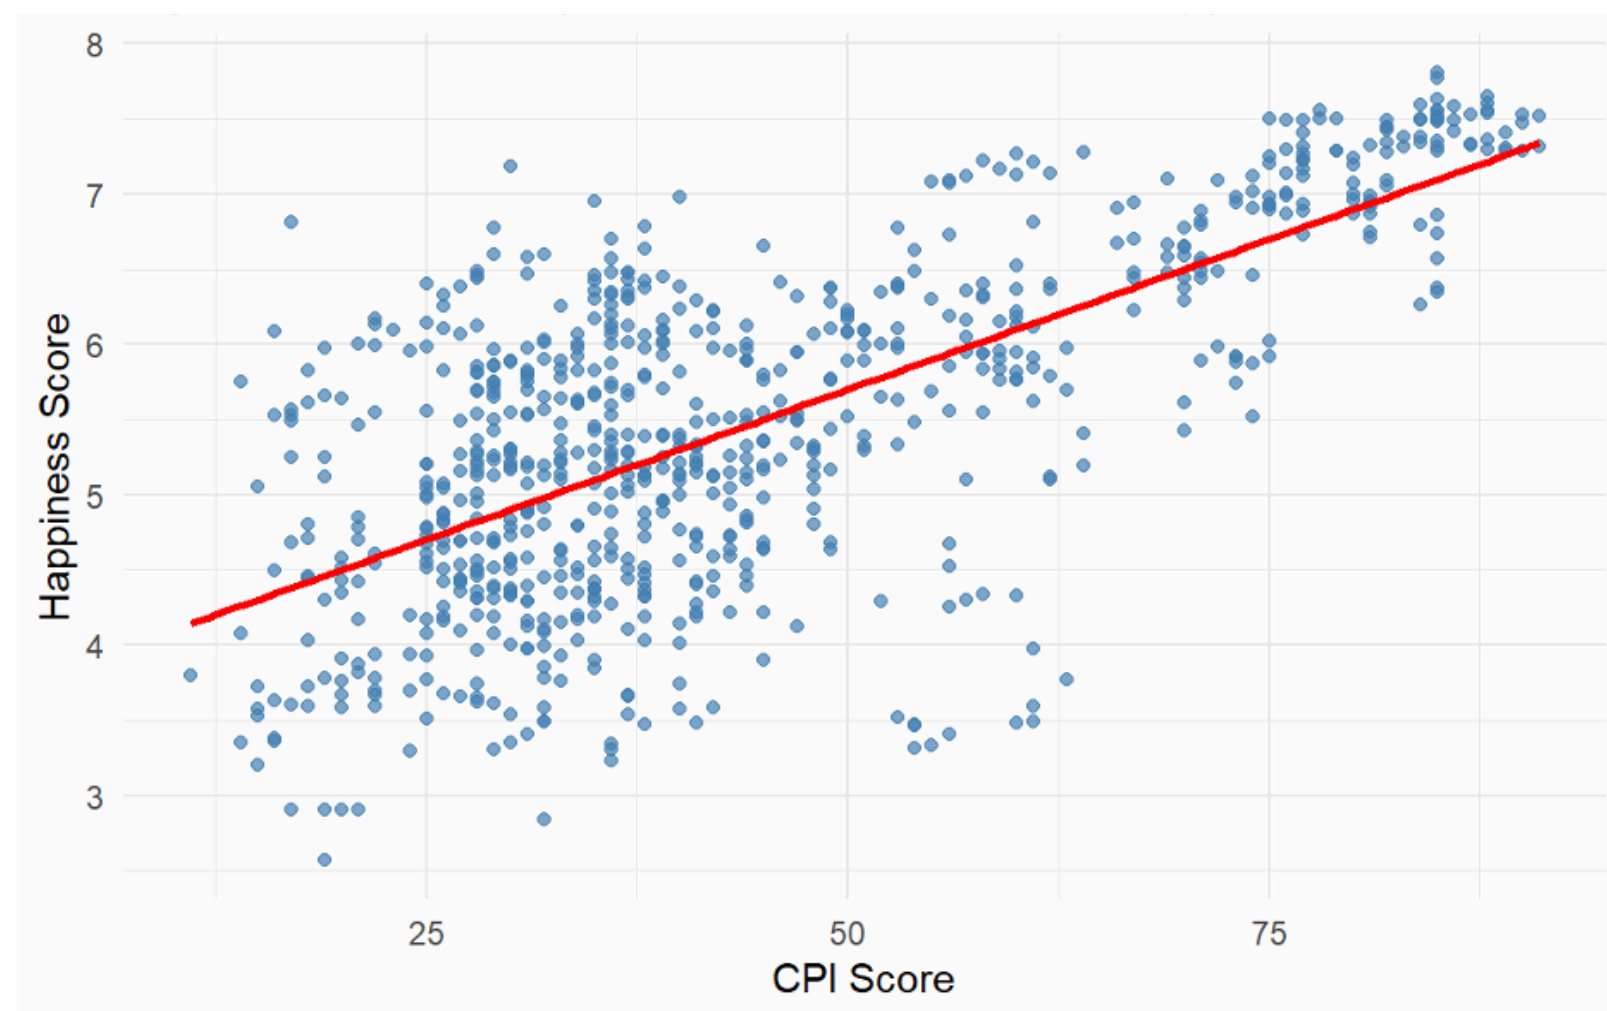

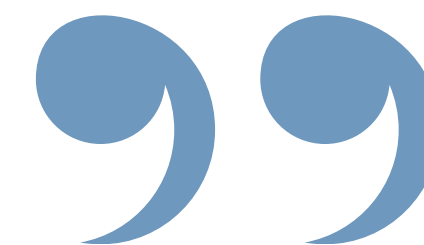

- R
- ggplot2
- dplyr
- Linear Regression

Dataset

- 792 observations
- 2015–2020 dataset

-by Aayushi

Analysis of 792 observations across multiple countries (2015–2020)

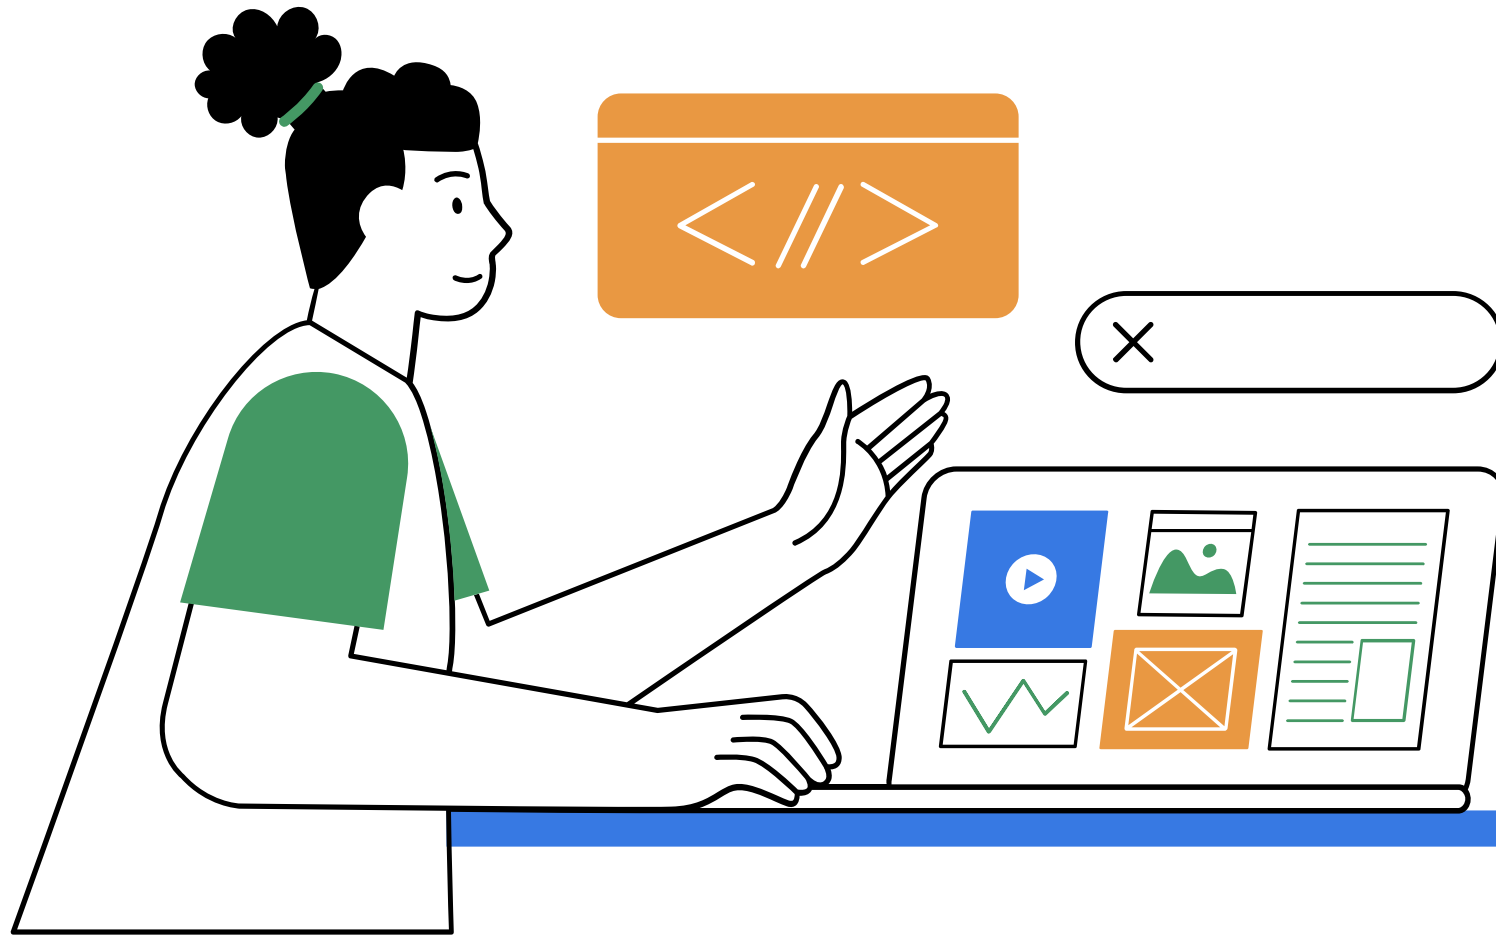

Relationship Between Corruption Perception and Happiness

Research Question

Is there a statistically significant relationship between Corruption Perception Index (CPI) scores and happiness levels across countries?

Key Insight

The analysis revealed a positive relationship between CPI and happiness scores, suggesting that countries with higher CPI scores generally reported higher happiness levels.

Skills Demonstrated

- Data Cleaning & Preparation
- Exploratory Data Analysis (EDA)
- Data Visualization
- Statistical Analysis
- Linear Regression
- R Programming

Key Findings

- A positive relationship was observed between CPI and Happiness Scores.
- Countries with higher CPI scores generally reported higher levels of happiness.
- Linear regression identified CPI as a statistically significant predictor of happiness.
- The findings suggest that lower perceived corruption may be associated with greater societal well-being.

Tools Used

R | ggplot2 | dplyr | Statistical Modelling

Project Outcome

Successfully applied analytical and statistical techniques to explore real-world data and generate evidence-based insights.
